R and RStudio Cheatsheet

Preliminaries

Load package

```
library (hanoverbase)
```

Load Data

Data from package

```
data(counties)
View(counties) # Only in console
help(counties) # Only in console
```

Data Import • Upload local file or use a URL

- File > Import > Dataset > From ...
- Add import code to code chunk (exclude the View command)

Data Viewer

Order rows • Click on column heading

• Click again to change direction

Filter

- Click Filter button on top left of viewer
- Use controls below column headings

Search • Use the search box in top-right

RMarkdown Basics

Main section \#\# Heading here

Subsection \#\#\# Heading here

Italic *text here*

Bold **text here**

Numbered List 1. text here

Unnumbered List - text here

Blockquote > text here

Summaries

Numerical Variable

favstats

```
favstats(~pop2010, data=counties)
favstats(miles~direction, data=driving) # miles by direction
favstats(~miles|direction, data=driving) # same thing
```

median etc

```
median(~female|state, data=counties) %>% sort()
iqr(~poverty|state, data=counties)
```

Categorical Variable

frequency

```
tally (~state, data=counties)
tally (~state, data=counties) %>% sort()
```

relative frequency

```
tally (~genhealth, data=brfss, format="percent")
```

Two Variables

Crosstabs

```
# Column-wise percents
tally(~genhealth|sex, data=brfss, format="percent", useNA="no")
# Total percents
tally(~genhealth+sex, data=brfss, format="percent", useNA="no")
```

Correlation

```
cor(mort_rate ~own_rate, data=guns)
```

Graphs

One Variable

Pie Chart

```
tally (~genhealth, data=brfss, useNA="no") %% pie()
```

Histogram

```
histogram(~pop2010, data=counties, breaks=20)
histogram(~pop2010, data=counties %>% filter(pop2010 <= 2e6))
```

Barchart

```
tally (~state, data=counties) %% barchart()
tally (~state, data=counties) %% sort() %>% barchart() # Pareto chart
```

Labeled Dotplot

```
sum(~own_rate|country, data=guns) %% sort() %% dotplot()
```

Two Variables

100% Stacked Barchart

```
healthVsExer <- tally(~genhealth|exerciseany, data=brfss,
format="percent", useNA="no")
healthVsExer %% t() %>% barchart(auto.key=list(space="right"))
```

Scatterplot

```
xyplot(mort_rate ~own_rate, data=guns)
ladd(panel.loess(x, y, col="magenta", lwd=2)) # add smooth fit line
```

Boxplot

```
bwplot(state~female, data=counties)
```

Three Variables

Paneled Scatterplot

```
xyplot(mort_rate ~own_rate | hdicat, data=guns)
```

Colors

list by name

```
colors() # in console
```

palette list

```
display.brewer.all() # in console
```

pick a palette

```
brewer.pal(4, "Accent")
```

add in graph

```
... plot ... ( ... , col=name-or-palette , ... )
```

Graph Labeling

main title

```
...plot...(..., main="Distribution of ...", ...)
```

axis labels

```
... plot ...(..., xlab="x label here", ...)
... plot ...(..., ylab="y label here", ...)
```

Misc

Linear Modeling

add to graph

```
ladd(panel.lmline(x, y, col="magenta", lwd=2))
```

get model

```
fit <- lm(mort_rate ~own_rate , data=guns)
coefficients(fit)
summary(fit)</pre>
```

diagnostics

```
xyplot(resid(fit)~fitted(fit)) # residual plot
ladd(panel.abline(h=0))
cor(mort_rate~own_rate, data=guns)^2 # r-squared
```
